## I. MAGNETIC PERTURBATIONS IN FLUX COORDINATES

In the $r$, $\theta$, $\phi$ flux coordinate system (where all lengths are normalized to $R_0$, and all magnetic field-strengths to $B_0$), the perturbed magnetic field is written

$$\mathbf{b} = b^r\,\mathcal{J}\,\nabla\theta\times\nabla\phi + b^\theta\,\mathcal{J}\,\nabla\phi\times\nabla r + b^\phi\,\mathcal{J}\,\nabla r\times\nabla\theta. \tag{1}$$

T7 Eqs. (25) and (49) yield

$$b^r = \frac{1}{r\,R^2}\left(\frac{\partial}{\partial\theta} - {\rm i}\,n\,q\right)y, \tag{2}$$

$$b^\phi = \frac{x}{R^2}, \tag{3}$$

whereas TJ Eqs. (78), (79), (80), (98), and (99) imply that

$$y(r,\theta) = \sum_m \frac{\psi_m(r)}{m-n\,q(r)}\,{\rm e}^{\,{\rm i}\,m\,\theta}, \tag{4}$$

$$x(r,\theta) = n\sum_m \frac{Z_m(r)+k_m(r)\,\psi_m(r)}{m-n\,q(r)}\,{\rm e}^{\,{\rm i}\,m\,\theta}. \tag{5}$$

It follows that

$$R^2\,b^r = \frac{\rm i}{r}\sum_m \psi_m\,{\rm e}^{\,{\rm i}\,m\,\theta}, \tag{6}$$

$$R^2\,b^\phi = n\sum_m z_m\,{\rm e}^{\,{\rm i}\,m\,\theta}, \tag{7}$$

where

$$z_m = \frac{Z_m + k_m\,\psi_m}{m-n\,q}. \tag{8}$$

Now, TJ Eqs. (2) and (A10) yield

$$\mathcal{J}\,\nabla\cdot\mathbf{b} = \frac{\partial}{\partial r}\left(r\,R^2\,b^r\right) + \frac{\partial}{\partial\theta}\left(r\,R^2\,b^\theta\right) - {\rm i}\,n\,r\,R^2\,b^\phi = 0, \tag{9}$$

[a] rfitzp@utexas.edu

so

$$\frac{\partial}{\partial\theta}\,(r^2\,R^2\,b^\theta) = \mathrm{i}\sum_m\left[-r\,\frac{d\psi_m}{dr}+\frac{n^2\,r^2\,(Z_m+k_m\,\psi_m)}{m-n\,q}\right]\mathrm{e}^{\,\mathrm{i}\,m\,\theta}. \tag{10}$$

But, TJ Eq. (102) gives

$$r\,\frac{d\psi_m}{dr} = \sum_{m'}\frac{L_m^{m'}\,Z_{m'}+M_m^{m'}\,\psi_{m'}}{m'-n\,q}, \tag{11}$$

so

$$\frac{\partial}{\partial\theta}\,(r^2\,R^2\,b^\theta) = -\mathrm{i}\sum_m \chi_m\,\mathrm{e}^{\,\mathrm{i}\,m\,\theta}, \tag{12}$$

where

$$\chi_m(r) = \sum_{m'}\frac{\chi_m^{m'}}{m'-n\,q}, \tag{13}$$

$$\chi_m^{m'}(r) = (L_m^{m'}-n^2\,r^2\,\delta_m^{m'})\,Z_{m'}+(M_m^{m'}-n^2\,r^2\,\delta_m^{m'}\,k_{m'})\,\psi_{m'} \tag{14}$$

Note from TJ Eqs. (100), (262), (263), (266), (267), (268), and (269) that $\chi_0^{m'}=0$ for all $m'$, which implies that $\chi_0(r)=0$. Thus,

$$r\,R^2\,b^\theta = -\frac{1}{r}\sum_m^{m\neq 0}\hat{\chi}_m\,\mathrm{e}^{\,\mathrm{i}\,m\,\theta}, \tag{15}$$

where

$$\hat{\chi}_m(r) = \frac{\chi_m}{m}. \tag{16}$$

According to Eqs. (4), (26), (79), and (98) of TJ,

$$\xi^r = \frac{q}{r\,g}\sum_m\hat{\psi}_m\,\mathrm{e}^{\,\mathrm{i}\,m\,\theta}, \tag{17}$$

where

$$\hat{\psi}_m(r) = \frac{\psi_m}{m-n\,q}. \tag{18}$$

## II. REGULARIZATION

In evaluating the perturbed magnetic field associated with the unreconnected eigenfunction at the $k$th rational surface, we make the transformation

$$\frac{1}{m_k-n\,q}\to\frac{m_k-n\,q}{\delta_k^2+(m_k-n\,q)^2}, \tag{19}$$

where $m_k$ is the resonant poloidal mode number at the $k$th rational surface, and

$$\delta_k = \frac{m_k\,s(r_k)}{2\,\hat{r}_k}\,\frac{W_k}{\epsilon_a}. \tag{20}$$

Here, $r_k = \epsilon_a\,\hat{r}_k$ is the minor radius of the $k$th rational surface, $s(r)$ is the magnetic shear, and

$$W_k = 4\left(\frac{q}{g\,s}\right)_{r_k}^{1/2}\Psi_k^{1/2} \tag{21}$$

is the magnetic island width at the $k$th rational surface. Thus,

$$\frac{\Psi_k}{\epsilon_a} = \epsilon_a\left(\frac{W_k}{4\,\epsilon_a}\right)^2\left(\frac{g\,s}{q}\right)_{r_k}. \tag{22}$$

For the special case of an $m = 1$ mode,

$$\delta_k = \frac{m_k\,s(r_k)}{2\,\hat{r}_k}\,\frac{\xi_k}{\epsilon_a}, \tag{23}$$

$$\frac{\Psi_k}{\epsilon_a} = \epsilon_a\left(\frac{\hat{r}\,g\,s}{q}\right)_{r_k}\frac{1}{|E_{kk}|}\left(\frac{\xi_k}{\epsilon_a}\right), \tag{24}$$

where $\xi_k$ is the displacement of the plasma core.

## III. MAGNETIC PERTURBATIONS IN CYLINDRICAL COORDINATES

We can write the perturbed magnetic field associated with the tearing mode that reconnects magnetic flux at the $k$th rational surface as

$$b^R \equiv \mathbf{b}\cdot\nabla R = b^r\,\frac{\partial R}{\partial r} + b^\theta\,\frac{\partial R}{\partial\theta}, \tag{25}$$

$$b^Z \equiv \mathbf{b}\cdot\nabla Z = b^r\,\frac{\partial Z}{\partial r} + b^\theta\,\frac{\partial Z}{\partial\theta}, \tag{26}$$

$$R\,b^\phi \equiv R\,\mathbf{b}\cdot\nabla\phi = R\,b^\phi. \tag{27}$$

Thus,

$$b^R(r,\theta,\phi) = b^R_C(r,\theta)\,\cos(n\,\phi) + b^R_S(r,\theta)\,\sin(n\,\phi), \tag{28}$$

$$b^Z(r,\theta,\phi) = b^Z_C(r,\theta)\,\cos(n\,\phi) + b^Z_S(r,\theta)\,\sin(n\,\phi), \tag{29}$$

$$R\,b^\phi(r,\theta,\phi) = b^\phi_C(r,\theta)\,\cos(n\,\phi) + b^\phi_S(r,\theta)\,\sin(n\,\phi), \tag{30}$$

$$\xi^r(r,\theta,\phi) = \xi^r_C(r,\theta)\,\cos(n\,\phi) + \xi^r_S\,\sin(n\,\phi), \tag{31}$$

where

$$b_C^R(r,\theta) = -\frac{\Psi_k}{\epsilon_a\,\hat{r}\,R^2}\left\{\frac{1}{\epsilon_a}\frac{\partial R}{\partial \hat{r}}\sum_m\left[\mathrm{Re}(\psi_m)\,\sin(m\,\theta)+\mathrm{Im}(\psi_m)\,\cos(m\,\theta)\right]\right. \tag{32}$$

$$\left.+\frac{1}{\epsilon_a\,\hat{r}}\,\frac{\partial R}{\partial\theta}\sum_{m\neq 0}\left[\mathrm{Re}(\hat{\chi}_m)\,\cos(m\,\theta)-\mathrm{Im}(\hat{\chi}_m)\,\sin(m\,\theta)\right]\right\}, \tag{33}$$

$$b_S^R(r,\theta) = -\frac{\Psi_k}{\epsilon_a\,\hat{r}\,R^2}\left\{\frac{1}{\epsilon_a}\frac{\partial R}{\partial \hat{r}}\sum_m\left[-\mathrm{Re}(\psi_m)\,\cos(m\,\theta)+\mathrm{Im}(\psi_m)\,\sin(m\,\theta)\right]\right. \tag{34}$$

$$\left.+\frac{1}{\epsilon_a\,\hat{r}}\,\frac{\partial R}{\partial\theta}\sum_{m\neq 0}\left[\mathrm{Re}(\hat{\chi}_m)\,\sin(m\,\theta)+\mathrm{Im}(\hat{\chi}_m)\,\cos(m\,\theta)\right]\right\}, \tag{35}$$

$$b_C^Z(r,\theta) = -\frac{\Psi_k}{\epsilon_a\,\hat{r}\,R^2}\left\{\frac{1}{\epsilon_a}\frac{\partial Z}{\partial r}\sum_m\left[\mathrm{Re}(\psi_m)\,\sin(m\,\theta)+\mathrm{Im}(\psi_m)\,\cos(m\,\theta)\right]\right. \tag{36}$$

$$\left.+\frac{1}{\epsilon_a\,\hat{r}}\,\frac{\partial Z}{\partial\theta}\sum_{m\neq 0}\left[\mathrm{Re}(\hat{\chi}_m)\,\cos(m\,\theta)-\mathrm{Im}(\hat{\chi}_m)\,\sin(m\,\theta)\right]\right\}, \tag{37}$$

$$b_S^Z(r,\theta) = -\frac{\Psi_k}{\epsilon_a\,\hat{r}\,R^2}\left\{\frac{1}{\epsilon_a}\frac{\partial Z}{\partial \hat{r}}\sum_m\left[-\mathrm{Re}(\psi_m)\,\cos(m\,\theta)+\mathrm{Im}(\psi_m)\,\sin(m\,\theta)\right]\right. \tag{38}$$

$$\left.+\frac{1}{\epsilon_a\,\hat{r}}\,\frac{\partial Z}{\partial\theta}\sum_{m\neq 0}\left[\mathrm{Re}(\hat{\chi}_m)\,\sin(m\,\theta)+\mathrm{Im}(\hat{\chi}_m)\,\cos(m\,\theta)\right]\right\}, \tag{39}$$

$$b_C^\phi(r,\theta) = \frac{n\,\Psi_k}{R}\sum_m\left[\mathrm{Re}(z_m)\,\cos(m\,\theta)-\mathrm{Im}(z_m)\,\sin(m\,\theta)\right], \tag{40}$$

$$b_S^\phi(r,\theta) = \frac{n\,\Psi_k}{R}\sum_m\left[\mathrm{Re}(z_m)\,\sin(m\,\theta)+\mathrm{Im}(z_m)\,\cos(m\,\theta)\right], \tag{41}$$

$$\xi_C^r(r,\theta) = \frac{\Psi_k\,q}{\epsilon_a\,\hat{r}\,g}\sum_m\left[\mathrm{Re}(\hat{\psi}_m)\,\cos(m\,\theta)-\mathrm{Im}(\hat{\psi}_m)\,\sin(m\,\theta)\right], \tag{42}$$

$$\xi_S^r(r,\theta) = \frac{\Psi_k\,q}{\epsilon_a\,\hat{r}\,g}\sum_m\left[\mathrm{Re}(\hat{\psi}_m)\,\sin(m\,\theta)+\mathrm{Im}(\hat{\psi}_m)\,\cos(m\,\theta)\right]. \tag{43}$$

## IV. VALUE OF $k_m$

Now,

$$\tilde{k}_m = -\frac{2-s}{m}-\frac{\epsilon_a^2}{m}\left(-\hat{r}\,p_2'+\frac{3\,\hat{r}^{\,2}}{2}-2\,\hat{r}\,H_1'+S_2\right)$$
$$+\,\epsilon_a^2\,\frac{(2-s)}{m}\left(-\frac{3\,\hat{r}^{\,2}}{4}+\frac{\hat{r}^{\,2}}{q^2}+H_1+S_1\right)$$

$$+\,\epsilon_a^{\,2}\,\frac{n\,\hat{r}}{m^2}\left[-q\,p_2'+\frac{\hat{r}}{m\,q}\,(2-s)\,(m-n\,q)\right]. \tag{44}$$

But, for the special case $m=0$,

$$\begin{aligned}\tilde{k}_0 &= -\frac{q\,p_2'}{n\,\hat{r}}-\frac{2-s}{n\,q}\\ &\quad-\frac{\epsilon_a^{\,2}}{n\,q}\left(\frac{3\,\hat{r}^{\,2}}{2}-2\,\hat{r}\,H_1+S_2\right)\\ &\quad+\epsilon_a^{\,2}\,\frac{(2-s)}{n\,q}\,\left(-\frac{3\,\hat{r}^{\,2}}{4}+\frac{\hat{r}^{\,2}}{q^2}+H_1+S_1\right)\\ &\quad+\epsilon_a^{\,2}\,\frac{q\,p_2'}{n\,\hat{r}}\left(2\,g_2+\frac{\hat{r}^{\,2}}{2}+\frac{\hat{r}^{\,2}}{q^2}-2\,H_1-3\,\hat{r}\,H_1'\right).\end{aligned} \tag{45}$$

It turns out that

$$k_m=\tilde{k}_m-\tilde{k}_0 \tag{46}$$

for all $m$.
